Owners of the Tahlequah City Hospital decided to build a new Medical Office Building in Tahlequah, Oklahoma. They wanted to use a variable refrigerant system for the four-story building (43,000 sq.ft.) but they knew the VRV system would need to be complemented with an outdoor air delivery system. Flynt & Kallenberger Consulting Engineers of Oklahoma designed the HVAC system and included Energy Recovery Ventilators (ERV) that work well for both summer and winter operation.

While reviewing ERV product lines used in previous projects, the engineer realized the building's design and construction might not have the physical space available to include the necessary ERV's into the building. However, during the design phase of this project, Chad Smith of Airetech Corporation contacted the engineer about a new Ruskin product, the MiniVentilator. Ruskin's new low profile ERV would bring in the necessary outside air needed to meet ASHRAE Standard 62 without using too much precious space. Ruskin's MV Series was the solution to overcome the issues of limited space while providing superior humidity control.

In addition to considering the hot humid summer months, Roush knew the ERV system would provide energy savings in the winter months as well because Oklahoma can experience really cold weather. Without using an ERV in this system, supplemental heaters would need to be installed to raise the leaving air temperature to the desired set point during low ambient conditions. Choosing to include ERVs resulted in cost savings in two ways. First by avoiding the initial cost of purchasing and installing the supplemental heaters, and then the on going cost savings associated with not having to use the heaters.
**FINAL DECISION**

Using the flexibility of Ruskin’s new product, the four-story project was designed with two MiniVentilators per floor. The tempered air from the ERV’s was tied to the various incoming air ducts with balancing dampers. The design allows for a significant amount of humidity control and lowers the temperature of the incoming air stream, which will help reduce the stress on the cooling system.

**GOOD FIT ALL AROUND**

Using Energy Recovery Ventilators in the new Tahlequah Medical Office Building will provide consistent, comfortable air as well as dramatic energy savings for the owners over a building that did not utilize ERV’s in its HVAC system. Engineers now have a product available to use when space is a limited commodity in a building’s design. The flexibility of Ruskin’s MiniVentilator can be utilized in future designs when energy recovery is beneficial.

---

**ESTIMATED ENERGY SAVINGS**

- **Initial Equipment Cost Savings**
  - $22,400*  

- **Energy savings delivered directly from the ERVs pre-conditioning the fresh air.**
  - $8,500/Annually**

---

* Estimated cost of purchase and installation assuming that each of the 64 VRV units needed supplemental heat. 

** Savings amount using Ruskin Rooftop Systems’ ERV selection software, which takes into account design conditions, climate and utility rates.

---

*The low profile of the MV 750 makes for easy installation in tight spaces above the ceiling.*
